VETERINARY CONSULTATION REPORT

Report 6ab9743db13e1b008562596c

PATIENT & APPOINTMENT

Pet
Leo ? Cat ? Domestic Short Hair

Age / Gender
3 ? Male

Owner
smartpaw team

Doctor
SmartPaw Doctor

Consultation date and time
1 Oct 2026 ? 16:24

Chief complaint
Appetite problem

CLINICAL ASSESSMENT

Symptoms / history
Reduced food and water intake with marked lethargy and decreased activity for 1-2 days. Owner reports that Leo is mostly sleeping and is not behaving normally.

Clinical observations
Based on the reported history, Leo appears lethargic with reduced appetite and water intake. No physical examination or vital signs were available during the remote consultation. Hydration status could not be confirmed remotely.

Diagnosis / assessment
Acute anorexia/hyporexia with lethargy and reduced water intake. Underlying cause is undetermined through remote consultation. Gastrointestinal, metabolic, infectious, or other systemic causes should be considered and ruled out through an in-person veterinary examination if symptoms persist or worsen.

Consultation summary
Leo was evaluated for reduced appetite, reduced water intake, lethargy, and decreased activity for approximately 1-2 days. The consultation focused on assessing the severity of his symptoms, hydration status, possible gastrointestinal causes, and determining the need for in-person veterinary evaluation.

TREATMENT PLAN

Treatment
Supportive care and close monitoring recommended while arranging veterinary evaluation. Do not force-feed Leo. Encourage small, frequent amounts of fresh water and monitor food and water intake, urination, activity, and vomiting/diarrhea if present.

Medication
No medication prescribed during this remote consultation.

Dosage
NA

Frequency
NA

Duration
NA

CARE & FOLLOW-UP

Additional instructions / home care
Keep Leo in a quiet, comfortable environment and monitor his behavior closely. Record his food and water intake and watch for vomiting, diarrhea, difficulty breathing, worsening weakness, or other new symptoms.

Diet / hydration advice
Offer fresh water frequently in small amounts. Offer his usual palatable food in small portions without forcing him to eat. Avoid human medications and unfamiliar foods.

Follow-up recommendation
Arrange an in-person veterinary examination as soon as possible, particularly if Leo continues refusing food or water or remains lethargic. Follow up sooner if his condition worsens.

Warning / emergency instructions
Seek urgent veterinary care if Leo becomes severely weak or unresponsive, has difficulty breathing, repeated vomiting, collapse, seizures, significant pain, blood in vomit/stool, or is unable to keep water down.

Final remarks
Please continue monitoring Leo closely and arrange an in-person veterinary evaluation. If his condition deteriorates or any emergency warning signs appear, seek immediate veterinary care.

Additional notes
This assessment is based on information provided during a remote consultation. A definitive diagnosis cannot be established without physical examination and, if indicated, diagnostic testing. Continued poor intake and lethargy in a cat warrant prompt veterinary assessment.
